/note="Organ: Lung; Vector: pXx-Asc; Site 1: EcoR I;
Site 2: Not I; The library was constructed according
Bonaldo, Lennon and Soares, Genome Research, 6:791-806,
1996. Denatured RNA was size fractionated on a I* agarose
gel: First strand cDNA synthesis was primed with oligo-dT
primer containing a Not I site. Double strand cDNA was
size selected according to mRNA size fraction, ligated
with EcoR I adaptor, digested with Not I and then cloned
directionally into pXx-Asc vector. The library tag
sequence located between the Not I site and the polyA tail
is GATAAAGGCCA. Tissue was provided by Mary Hendrix."

/lab nost="bulbe fulle leconologies" / clone libe "Note "Corgan: Chondrosarcoma; Vector: pT7T3-Pac (Pharmacia) with a modified polylinker; Site_1: Ec (Pharmacia) with a modified polylinker; Site_1: Ec Site_2: Not I; NoT CGAP FE1 is a normalized cDNA ] derived from a pool of mRNA obtained from 3 cell lrom grade II chondrosarcoma tissues. The library constructed according to Bonaldo, Lennon and Soare Genome Research, 6:791-806, 1996. First strand cDN synthesis was primed with an oligo-dr primer conte Not I site. Double stranded cDNA was ligated to adaptor, digested with Not I, and cloned direction into pT7T3-Pac vector. The oligonucleotide used to the synthesis of first-strand cDNA contains a libr sequence that is located between the Not I site ar (GT) R ail. The sequence that is located between the Not I site ar (GT) at all these were provided by Dr Jan Martin from the University of lowe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     TAG_TISSUB=Human grade 2 chondrosarcoma cell line

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Denial: cgapbs-remain_nih.gov
The sequence contained an oligo-dT track that was present contained that was used to prime the synthesis of fin strand cDNA and therefore this may represent a bonafide potail. cDNA Library Preparation: M.B. Soares Lab Clone distinct. CARP clone distribution information can be found throw. I.M.A.G.E. Consortium/LIML and strand contains and the following repetielements were found in this cDNA sequence: 49-81,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Eutelec

Plasmid DNA from the normalized library NCI CGAP Kid3 was
prepared, and se circles were made in vitro. Following HAP
purification, this DNA was used as tracer in a subtractive
hybridization reaction. The driver was PCR-amplified cDNAs
from a pool of 5,000 clones made from the same library
(cloneIDS 1322376-1323911, 1456007-1456775, and
1500552-1502855). Subtraction by Bento Soares and M.
Fatima Bonaldo.

```
Site 2: Sall; Starting library constructed using SuperScript Plasmid Library kit (Life Technologies). CDNA made by oligo-dT priming. Size-selected by column fractionation, average insert size 1.08 kb. Library was amplified once on solid support and plasmid DNA from library was prepared. The library DNA was normalized by method #4 from Bonaldo, Lennon, and Soares 1996 Genome Research 6:791-806; 0.5 microgram single-stranded library plasmid DNA was mixed with 5 micrograms PCR product representing library inserts and hybridized to an Ecot of 20. Single-stranded (unhybridized) plasmids were isolated by hydroxyapatite chromatography and used to make this library."

/note="Organ: pooled; Vector: pT7T3D-Pac (Pharmacia) with
a modified polylinker; Site 1: Not I; Site 2: Eco RI;
Equal amounts of plasmid DNA from three normalized
libraries (fetal lung NbHL19W, testis NHT, and B-cell
NCI CGAP GCB1) were mixed, and ss circles were made in
vitro. Following HAP purification, this DNA was used as
tracer in a subtractive hybridization reaction. The driver
was PCR-amplified cDNAs from pools of 5,000 clones made
from the same 3 libraries. The pools consisted of
I.M.A.G.E. clones 297480-302087, 682632-667239,
726408-728711, and 729096-31339. Subtraction by Bento
Soares and M. Fatima Bonaldo. "

following tissue(s): retina. The library was const according to Bonaldo, Lennon and Soares, Genome RK 6:791-806, 1996. First strand CDNA synthesia was I with an oliqo-dr primer containing a Not I site. I stranded cDNA was ligated to an ECOR I adaptor, d: with Not I, and cloned directionally into prime the vector. The oligonucleotide used to prime the synt first-strand cDNA contains a library tag sequence located between the Not I site and the (d7)18 tail sequence tag for this library is CCGCG. This libric created for the program, Gene Discovery in the Vii System, supported by National Eye Institute (NEI)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Eutele Mammalia; Eutheria; Primates; Catarrhin; Hominidae; Homo. The library was constructed according to Bonaldo, Lennon and Soar Genome Research, 6:791-806, 1996. First strand Genome Research, 6:791-806, 1996. First strand Conton I site. Double stranded cDNA was ligated to adaptor, digested with Not I, and cloned directic into pry73-Pac vector. The oligonucleotide used the synthesis of first-strand cDNA contains a libracy expense that is located between the Not I site a (d7)18 tail. The sequence tag for this library is CATTAAGTC. This library was created for the prog Discovery in the Visual System, supported by Natil Institute (NEI)."

//note="Organ: eye; Vector: pT7T3-Pac (Pharmacia) with a modified polylinker; Site_1: EcoR 1; Site_2: Not 1; modified polylinker; Site_1: EcoR 1; Site_2: Not 1; Ul-E-Cll is a normalized cDNA library containing the Ul-E-Cll is a normalized cDNA library containing the following tissue(8): retina. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, ei.79-806. 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonuclectide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is CGGC. This library was created for the program, Gene Discovery in the Visual System, supported by National Eye Institute (NEI).

/note="Organ: pooled; Vector: pT7T3D-Pac (Pharmacia) with
a modified polylinker; Site 1: Not I; Site_2: Eco RI;
Equal amounts of plasmid DNA from three normalized
libraries (fetal lung NbHL19W, testis NHT, and B-cell
NCI CGAP GCB1) were mixed, and ss circles were made in
vitro. Following HAP purification, this DNA was used tracer in a subtractive hybridization reaction. The driver
was PCR-amplified cDNAs from pools of 5,000 clones made
from the same 3 libraries. The pools consisted of
I.M.A.G.E. clones 297480-302087, 682632-667239,
726408-728711, and 729096-731399. Subtraction by Bento
Soares and M. Fatima Bonaldo. "
